

## # EDA Summary

This exploratory analysis characterizes how mobile money users differ across the low, medium, and high

### ## Key Patterns

- Activity levels are imbalanced: most users fall into the low or medium segments, while a small core of u
- Total transaction volume grows rapidly with user activity, indicating a strong separation between low and
- Failed transaction attempts are concentrated among more active users and can signal friction points in
- Weekend activity is higher for medium and high activity users, suggesting that active users rely on mob
- Balance checks and adjustments appear as consistent engagement signals across the dataset.

### ## Visualizations

- `activity\_level\_distribution.png`: shows how users are distributed across activity categories.
- `transactions\_by\_type.png`: compares the frequency of different SMS transaction types in the cleaned d
- `volume\_vs\_frequency.png`: plots total transaction volume against monthly frequency by user segment.
- `feature\_correlation\_heatmap.png`: reveals the relationships between engineered user features.
- `monthly\_transaction\_volume.png`: displays the trend in transaction volume over time.
- `weekend\_activity\_ratio.png`: shows how weekend transaction balance differs by activity level.

### ## Summary Data

A compact `eda\_summary.csv` file is also generated to store user and transaction counts used in the ana
