

Interpretation Report

Top Predictive Features

The feature importance analysis identifies the strongest signals used by the model:

- `total\_transaction\_volume`
- `activity\_score`

What the Model Learns

- High activity users are primarily distinguished by large cumulative transaction volumes and frequent use
- The engineered `activity\_score` captures the combined effect of normalized volume, frequency, and average
- Failed transaction attempts and weekend activity serve as secondary signals, helping the model disting

Interpretation Notes

- The model places most weight on sustained volume, which aligns with the business goal of identifying
- Activity score is a robust signal because it reduces the noise of raw transaction counts and scales across
- Features with low importance in this analysis may still contain valuable information if the dataset grows

Supporting Artifacts

See `feature\_importance.csv` for the ordered importance values.

See `example\_predictions.csv` for sample predictions and how the model classified users across segments.
